

ENRECOS is an environmental organization that focuses on recycling organic materials. We feel these materials are not waste but, resources, if managed properly. Items like food waste, junk mail and certain animal manures are perfect to process into a rich soil amendment.

The majority of people living now days simply throw away their organic waste. They were not taught how to manage these materials in school, at home nor in their work place. ENRECOS is trying to change this problem through educational programs at schools, residential workshops and partnerships with various kinds of businesses. This education is accompanied with complete vermicomposting solutions for their individual requirements.

At schools, we conduct lectures on the art of vermicomposting to children of all ages. These students are excited to learn about our industrious pets. We have small units that can reside in their classroom to convey the concepts of vermicomposting. We also offer modular systems that can convert their entire cafeteria food waste into a rich soil amendment. This amendment can then be applied to their school garden or landscape around the campus. Using this soil amendment will contribute to reducing costs for waste disposal, fertilization and pesticides. These costs savings can be combined with the reduction of water consumption too.

Our residential workshops are held locally, within communities to educate the residents on the art of vermicomposting. Besides providing information, ENRECOS also makes available, turn key solutions at the workshops. This convenience allows workshop attendees to leave with all necessary components to apply what they learned during the workshop. These residents also benefit in cost reduction with waste disposal, fertilization, pesticides and reduced water consumption.

Our partnerships with business cover a wide range business types and involvement levels. ENRECOS consults with organization on possible solutions of converting their organics. We also recommend and design solutions for processing their organics waste. Many times we assist with implementation of these solutions. Finally, ENRECOS can help with ideas for marketing their end products. The role ENRECOS plays vary with the requirements of the business. Some entities are interested in reducing costs, others in creating additional revenue streams.

Hopefully, with these educational efforts, ENRECOS can; help curb the perception of organic waste, encourage people to process their organic material where it is generated and apply these materials back into their environment. ENRECOS also helps our communities by manufacturing our bins locally, with local labor and local recycled plastic content.
